Team Approach

Question 1: How well to the team members understand the problem?

Question 2: How are the project tasks achieved?

Question 3: How did the team approach solving a problem?

Question 4: What approach was taken to solve the problem?

Overall Comments on team approach:

Team Coordination of Task Responsibilities

Question 1: How actively did team members take in interest and supported in terms of individual member responsibilities?

Question 2: How well did the completion of tasks require active interchanges and sharing of information among members?

Question 3: How well did the assignment of tasks to individuals match their expertise?

Question 4: How well did the team coordinate individual task assignments?

Overall Comments on team coordination of task responsibilities:

ANSWERS ARE ON PAGES 2 AND 3

Team Approach

Question #1

Across the entire semester, due to the labs we have completed in class being the preparation to most of this project, we were able to thoroughly understand what was required to successfully complete this assessment while using the best of our knowledge. Both team members provided equal effort across all aspects of the problems faced and the entirety of the project.

Question #2

To be as efficient as possible, all work was split up according to our individual strengths and what fit better in our own personal timelines, with the attention focused towards following the deadlines we set out for each aspect of the project. Once we completed our own tasks, we would discuss the results and make sure we are both satisfied with the work we completed – this was done to make sure all work was completed to the best of our capabilities and acceptable to our own standards and the project criterion.

Question #3

As the tasks were split up according to our strengths and timeline, whenever we come across an issue/problem, we would consult each other during the scheduled meeting times. During these times we would address any problems we would run into and focus on solving them so we can continue working on our own individual tasks required for the completion of the project.

Question #4

The most common approach to some of the problems would involve looking at various other options depending on what the problems were. If for example the issue was with our code, we would both look at it and run some tests to see what breaks and what does not – by completing this we more or less have some scenarios to see what is possibly causing the problems we are facing. As for the more project documentation-oriented material, we would verify through the strategies learned during the class and look at our completed labs to see what could be done to solve these problems. This approach basically meant that we would typically have the solutions through various resources given to us, so there was never a big problem we faced.

Overall Comments on Team Approach

As we have worked together on projects and activities prior to this semester, we already understood what our work habits are and what we are capable of completing given our own respective schedules and deadlines. This created the overall dynamic of the project to be fairly easy to complete since there were no issues to either of us slacking off and/or falling behind on schedule. Everything we designated and split up was taken into the consideration of how to maximize our potential success of the project while meeting the deadlines we set out for each section of the project.

Team Coordination of Task Responsibilities

Question #1

As stated in the previous questions, due to the method of us splitting up our work and completing the tasks that we are proficient at – it made sure that each member was doing what they are interested in while giving each member their own specific responsibilities to complete. The entirety of this project would not be possible without the individual factor known as the team members, we were able to collaborate and provide results to our team coordination for this project.

Question #2

Due to the way we chose to take on this project, the interchanges and sharing of knowledge was not as extensive as it would normally be. This is mainly because we were able to generally solve the issues, we ran into ourselves and the rare but seldom ones we faced, we would be able to look at two different views and come up with a solution that is approved by both team members.

Question #3

The assignment of tasks to each individual was perfectly designated as the problems we faced were minimal due to the fact that the tasks we were given are more or less considered our strong suites. The way these tasks were assigned also brings in the fact that the work we provided for the overall project was approved according to our own individual standards and making sure that it meets the requirements of the overall project assessment.

Question #4

In this regard, almost 85-90% of the project was done as individual task assignments – the remaining 10-15% was the completion of our report, repository, and the overall correctness of our program which we worked on together to get the satisfactory results and intent we wanted. Our team coordination has been exceptional throughout and we are happy to say that the way everything was handled was perfect, as there were no concerns or issues against each other and anything that needed the consultation of both members was handled very well and easily had solutions.

Overall Comments on Team Coordination of Task Responsibilities

Similar to how we've mentioned throughout this assessment, the team coordination of both members on their own fixed tasks has been perfect and due to collaborating in the past before and throughout this semester for multiple labs, activities and assignments as well as the main project – it was very easy to complete our work. This shows in the quality of work we provided for this project and our other activities all semester long, neither members have any complaints about the work we have provided and the end result of the work we completed.
